

=====

The following files are given in order:

- A) to verify TeX hyphenation on 500 french words.
- B) to provide a sample for testing your keyboard.

These tests have to be used after installation i.e. creation of the format file.

These files were fully tested using MlTeX/TeX V3 with EC or CM fonts.

Here are the corresponding files for part A:

=====

```
EC.def          an internal file, for input encoding just like EC.
TSIv5n4.tex     500 words hyphenated (Desarmenien's reference)
                This is a 7-bit file to transform to your 8-bit keyboard-screen.
gencoup.tex     to hyphenate these words with TeX at your site (log file)
lgencoup.tex    "      "      "      "      "      "      "      "      "      "
tstcoup.tex     to read the log file produced with TeX & compare with ideal list
ltstcoup.tex    "      "      "      "      "      "      "      "      "      "
testhyp         a shell script to do this with TeX
lttesthyp       "      "      "      "      "      "      "      "      "      "
```

Operation:

- convert TSIv5n4.tex to 8-bit accordingly to your own keyboard (use kb7to8 !)
 - run the l/testhyp procedure to look if your installation is ok at the hyphenation level. Any system with TeX-only i.e. without Multi-lingual modifications or without 8-bit fonts can't be called a french system and this test would be a non-sense.
- This script gives normally 0 bad hyphenated words with MlTeX+CM or TeX+EC fonts. No difference should occur.

Here are the corresponding files for part B:

=====

```
kbtest.tex      the test code (8-bit file) to be adapted to your keyboard.
```

Operation:

- update this file accordingly to your own keyboard and run it with your TeX engine. You will obtain a print sheet with a comparison of 7-bit and 8-bit inputs.

Hope it helps,

Bernard GAULLE
